Execution flow

Change execution

By default, Streamlit apps execute the script entirely, but we allow some functionality to handle control flow in your applications.

[screenshot](#)

[Modal dialog](#)

[Insert a modal dialog that can rerun independently from the rest of the script.](#)

```
@st.dialog("Sign up") def email_form(): name = st.text_input("Name") email = st.text_input("Email").
```

[Fragments](#)

[Define a fragment to rerun independently from the rest of the script.](#)

```
@st.fragment(run_every="10s") def fragment(): df = get_data() st.line_chart(df).
```

[Rerun script](#)

[Rerun the script immediately.](#)

```
st.rerun().
```

[Stop execution](#)

[Stops execution immediately.](#)

```
st.stop().
```

Group multiple widgets

By default, Streamlit reruns your script everytime a user interacts with your app. However, sometimes it's a better user experience to wait until a group of related widgets is filled before actually rerunning the script. That's what `st.form` is for!

[Forms](#)

[Create a form that batches elements together with a “Submit” button.](#)

```
with st.form(key='my_form'): name = st.text_input("Name") email = st.text_input("Email").
st.form_submit_button("Sign up").
```

[Form submit button](#)

[Display a form submit button.](#)

```
with st.form(key='my_form'): name = st.text_input("Name") email = st.text_input("Email").
st.form_submit_button("Sign up").
```

Third-party components

These are featured components created by our lovely community. For more examples and inspiration, check out our [Components Gallery](#) and [Streamlit Extras](#)!

[Autorefresh](#)

[Force a refresh without tying up a script.](#)
[Created by @kmcgrady.](#)

```
from streamlit_autorefresh import
st_autorefresh
st_autorefresh(interval=2000,
limit=100, key="fizzbuzzcounter")
```

Pydantic

Auto-generate Streamlit UI from
Pydantic Models and Dataclasses.
Created by @lukasmasuch.

```
import streamlit_pydantic as sp
sp.pydantic_form(key="my_form",
model=ExampleModel)
```

Streamlit Pages

An experimental version of Streamlit
Multi-Page Apps. Created by @blackary.

```
from st_pages import Page,
show_pages, add_page_title
show_pages([
Page("streamlit_app.py", "Home",
"🏠"),
Page("other_pages/page2.py", "Page
2", ":books:"), ])
```
