st.components.v1.html

Streamlit Version ▼

Display an HTML string in an iframe.

To use this function, import it from the `streamlit.components.v1` module.

If you want to insert HTML text into your app without an iframe, try `st.html` instead.

Warning

Using `st.components.v1.html` directly (instead of importing its module) is deprecated and will be disallowed in a later version.

st.components.v1.html(html, width=None, height=None, scrolling=False)

Parameters

html (str) The HTML string to embed in the iframe.

width (int) The width of the iframe in CSS pixels. By default, this is the app's default element width.

height (int) The height of the frame in CSS pixels. By default, this is 150.

scrolling (bool) Whether to allow scrolling in the iframe. If this `False` (default), Streamlit crops any content larger than the iframe and does not show a scrollbar. If this is `True`, Streamlit shows a scrollbar when the content is larger than the iframe.

Example

```
import streamlit.components.v1 as components

components.html(
    "<p><span style='text-decoration: line-through double red;'>Oops</span>!</p>"
)
```
